

719-OGE-CH

**Gas and Electric Combination Fixtures**  
During the turn of the century, when electricity supplies were first available but not reliable, companies made combination gas and electricity lights so when the electricity failed, they could turn up the gas light.

Our reproductions are available either with gas glass shades or with glass candletubes as on the next page; both were popular. Since gas always pointed up, and electricity pointed down (to get the most from meager electricity of the times), their shades are obvious. Gas is larger with a 4" fitter size while electric shades have a 2.25" fitter. Lights are priced without shades. You can select matching gas and electric shades from our shade page or use antique ones if you are fortunate to have them.
